C# Basics

Q1. What is boxing in C#?

Ans: Boxing converts a value type into an object reference by allocating on the heap.

Q2. What is unboxing?

Ans: Unboxing extracts the value type back from the object reference with an explicit cast.

Q3. What is a sealed class?

Ans: A sealed class cannot be inherited, which lets the runtime optimise virtual calls.

Q4. What is a static class?

Ans: A static class cannot be instantiated and only contains static members.

LINQ

Q5. What is deferred execution in LINQ?

Ans: The query is not run until you enumerate it, for example with foreach or ToList.

Q6. Difference between First and Single?

Ans: First returns the first match; Single throws if there is not exactly one match.
