Kubernetes

Q: What is a Pod?

A: The smallest deployable unit in Kubernetes. It holds one or more containers that share network and storage.

Q: What does a Deployment do?

A: It manages ReplicaSets, gives rolling updates and rollbacks, and keeps the desired number of pods running.

Linux

Q: What is a zombie process?

A: A process that has finished but whose parent has not yet read its exit status, so it stays in the process table.

Q: What does chmod 755 mean?

A: The owner can read, write and execute, while group and others can read and execute.

Cloud

Q: What is autoscaling?

A: Automatically adding or removing instances based on load so you keep performance and control cost.
